Art Unit: 1743

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 4. Claims 1-5, 7-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rao et al.

Rao teaches an analytical device having a temperature controlled (col. 3, lines 40-65) vial storage area 14, thermal equilibration area 16, bar code reader 58 for

Application/Control Number: 09/813,471

Art Unit: 1743

reading vial bar codes, and analytical modules 24, 26 for aspirating sample and forwarding to, e.g., a gas chromatograph. The temperature control and/or optical bar code reader constitute the instant energy source. The modules are adapted to mate with the base and only one or both can be provided (col. 4, lines 58-65). Module mounting can be achieved by providing holes and screwing the module to the base (col. 4, line 66- col. 5, line 4). Computer control is provided, including keyboard input (col. 8, lines 9-24, Fig. 11). The vial storage and movement may be provided by a carousel (col. 4, lines 18-20).

Rao fails to explicitly teach a turntable embodiment.

It would have been obvious to provide vial storage and movement with a turntable and drive in order to provide the alternative vial storage taught by Rao. With respect the right-angled flange, it would have been obvious to provide a base under the turntable analogous to the structure labeled 14 in Figure 1, the perpendicular wall constituting the other portion of the right angle. With respect to analytical programming, it is the examiner's position that analytical GCs inherently use analytical programming to locate and identify component peaks; alternatively, it would have been obvious to provide analytical programming to determine components in the peaks as was known in the art.

5. Claims 1-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Riley et al in view of Rao.

Riley teaches a device having a base supporting modules 4a-4f in trays, i.e., shallow "U" shaped support surface devices (col. 6, line 23). Vials are passed by the

Art Unit: 1743

modules on a conveyer. The vials have bar codes and an identification unit is provided (col. 5, line 40). The modules have moveable sampling arms 41, 47, 48 (fig. 5). A microprocessor is used to control operation of the apparatus, including skipping certain tests for certain samples, and read and store analytical results (col. 5, lines 59-68; col. 13, lines 10-23).

The teachings of Rao are given above.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide a carousel and drive in place of the conveyor belt of Riley in order to provide a known alternative to rectangular storage and movement device as taught by Rao. It would have been further obvious to attach the modules to the base, as by screws or other attachment means in order to provide secure attachment as taught by Rao. It would have been obvious to provide energy (e.g., thermal control) to the samples in the carousel in order to maintain them at a desired temperature prior to analysis as taught by Rao. It would have further been obvious to provide a keyboard to the microprocessor as taught by Rao for its known purpose of inputting information to a processor.

- 6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
- 7. Lillig additionally teaches modular analyzers.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jan M. Ludlow whose telephone number is (571) 272-
